The smart collections enable you to sort photos by type. Select a type from the menu, such as Raw, Film, or Web, to see all photos of that type. Select the person from your contacts who took the image, and Lightroom will show a thumbnail of the person's face as their image opens. Move your cursor to it and you can point the spot where you want to name the collection. If you move the image after naming a collection, then the name will be changed accordingly. Also, you can group images by location from within the list, which will remember the location until you change it. Also, you can create a folder view to see all the images for a particular year of birth, for example. A large part of the task of organizing your pictures is to prune them, which requires the extra step of adding a filter to reduce the image size. If this is done, Lightroom asks you whether or not you want it to delete the photo and to inform of the change. This is more convenient than having to ring up and ask. The Lenses carousel has a preview feature for the lighted ads, so as to let you see what your image looks like before opening it. The Lenses feature allows you to view your pictures by date or type. It also stores the associated lens metadata alongside the photo. Moreover, you can open the images by date or type, or via the search box. You can also view and change the white balance and exposure. This allows you to open and edit multiple photos at once. A mouse or trackpad is not required to access the menu system.

The other way Photoshop Elements makes the most of your non-pixel-peeping photo experiences is through new viewing choices that let you see the big picture

before you mess around with your images. One of the major problems that first-time Photoshop Elements users have is the lack of an overview mode of any kind. With that, you're always opening everything up in one big image, sometimes making saving your edits more difficult than necessary. The new Gallery view helps that, by presenting all your files in a folder-like arrangement, which you can expand to see all your files. From there, you can navigate to individual images by holding down ⌘-key on your keyboard, then navigating to the image you want to view. This gives you a lot more control over your photo assets, and it's typically easier to spot the one you want to work on. If you photograph live events such as weddings, birthdays, or graduations, you're probably interested in the new Wreath and Wreath Glow features. These add clever video effects that let you animate your images, à la old school video editing programs like VHS, for a unique social media-ready wedding presentation. There's also a new feature to help you shoot better photos. Rather than shoot blindly, you're now able to see your camera's "hotspots" as circles overlaid on your screen. This lets you know where your camera's autofocus point is during the shoot. That helps you capture more in your images, and also helps you avoid capturing blurs or weird bokeh effects from your subject as they move through the frame. Adobe also added a new Lens Blur feature that lets you create a soft blur effect around a subject.
